The Jackson Laboratory, an international leader in mammalian genetics and human genomics research, offers exciting opportunities for Ph.D. research and training on its campuses in Bar Harbor, Maine and Farmington, Conn.

JAX researchers use the laboratory’s outstanding genetic and bioinformatic resources to investigate genetics and disease. Students take advantage of the research environment to conduct dissertation research, complete lab rotations and engage in short-term collaborative projects.

We seek students with strong academic records, especially those with previous research experience. Our students receive competitive stipends and the JAX Graduate Student Organization provides a network and community for all graduate students.
“Being a predoctoral student here at JAX has been a fantastic experience. The scientific resources, intellectual minds and supportive environment have made my time here extremely productive and rewarding. I could not ask for a better graduate research experience!”

— Elisabeth Adkins
Doctoral Candidate, Roopenian Lab
